*(Received: 1 April 2011, Accepted: 23 May 2011)*

In this paper, new classes of functions are introduced and studied by making use of  $b-I$ -open sets and  $b-I$ -closed sets. Relationship between the new classes and other classes of functions are established besides giving examples, counterexamples, properties and characterizations.

**Keywords:**  $b-I$ -open;  $b-I$ -closed; somewhat  $b-I$ -continuous; somewhat  $b-I$ -open;  $b-I$ -dense;  $b-I$ -separable.

**AMS Subject Classification:** 54C10, 54A05, 54D25, 54D30.

#### 1. Introduction

Topological ideals have played an important role in topology for several years. It was the works of Newcomb [1], Rancin [2], Samuels [3] and Hamlet and Jankovic [4–8] which motivated the research in applying topological ideals to generalize the most basic properties in general topology. In 1992, Jankovic and Hamlett [7] introduced the notion of  $I$ -open sets in topological spaces. Abd El-Monsef et al. [9] investigated  $I$ -open sets and  $I$ -continuous functions. In 1996, Dontchev [10] introduced the notion of pre- $I$ -open sets and obtained a decomposition of  $I$ -continuity. Quite recently, Hatir and Noiri [11] have introduced the notion of semi- $I$ -open sets to obtain another new decomposition of continuity. In this paper, using the notion of  $b-I$ -open sets, the concepts of somewhat  $b-I$ -continuous functions and somewhat  $b-I$ -open functions are introduced and studied. Also characterizations for somewhat  $b-I$ -continuity is obtained besides giving examples and counterexamples.

Throughout this paper,  $cl(A)$  and  $int(A)$  denote the closure of  $A$  and the interior of  $A$ , respectively. Let  $(X, \tau)$  be a topological space and  $I$  an ideal of subsets of  $X$ . An *ideal topological space*, denoted by  $(X, \tau, I)$ , is a topological space  $(X, \tau)$  with an ideal  $I$  on  $X$ . For a subset  $A \subset X$ ,  $A^*(I) = \{x \in X : U \cap A \neq I \text{ for each neighborhood } U \text{ of } x\}$  is called the local function [10] of  $A$  with respect to  $I$  and  $\tau$ . We simply write  $A^*$  instead of  $A^*(I)$  in case there is no chance for confusion. Recall that  $Cl^*(A) = A \cup A^*$  defines a Kuratowski closure operator. In what follows the space  $(X, \tau, I)$  is always taken to be an ideal topological space.

**Definition 1.1** A subset  $A$  of an ideal space  $(X, \tau, I)$  is said to be:

- (1)  $I$ -open [9] if  $A \subseteq int(A^*)$ .
- (2) semi- $I$ -open [11] if  $A \subseteq cl^*(int(A))$ .
- (3)  $b-I$ -open [12] if  $A \subseteq int(cl^*(A)) \cup cl^*(int(A))$ .

**Definition 1.2** A function  $f : (X, \tau, I) \rightarrow (Y, \sigma)$  is said to be somewhat- $I$ -continuous function if for  $U \in \sigma$  and  $f^{-1}(U) \neq \phi$  there exists an  $I$ -open set  $V$  in  $X$  such that  $V \neq \phi$  and  $V \subseteq f^{-1}(U)$ .

**Definition 1.3** A function  $f : (X, \tau, I) \rightarrow (Y, \sigma)$  is said to be somewhat semi- $I$ -continuous if for  $U \in \sigma$  and  $f^{-1}(U) \neq \phi$  there exists an semi  $I$ -open set  $V$  in  $X$  such that  $V \neq \phi$  and  $V \subseteq f^{-1}(U)$ .

**Definition 1.4** A function  $f : (X, \tau, I) \rightarrow (Y, \sigma)$  is said to be  $I$ -continuous, the inverse image of each open set is  $I$ -open.

**Definition 1.5** A function  $f : (X, \tau, I) \rightarrow (Y, \sigma)$  is said to be semi- $I$ -continuous [11], the inverse image of each open set is semi- $I$ -open.

**Definition 1.6** A function  $f : (X, \tau) \rightarrow (Y, \sigma, I)$  is said to be  $I$ -open (resp. semi- $I$ -open) function if the image of open set  $U$  in  $(X, \tau)$  is  $I$ -open (resp. semi- $I$ -open) in  $(Y, \sigma, \tau)$ .

**Definition 1.7** A function  $f : (X, \tau) \rightarrow (Y, \sigma, I)$  is said to be somewhat- $I$ -open function provided that for  $U \in \tau$  and  $U \neq \phi$ , there exists an open set  $V$  in  $Y$  such that  $V \neq \phi$  and  $V \subseteq f(U)$ .

**Definition 1.8** A function  $f : (X, \tau) \rightarrow (Y, \sigma, I)$  is said to be somewhat semi- $I$  open function provided that for  $U \in \tau$  and  $U \neq \phi$ , there exists a semi- $I$ -open set  $V$  in  $Y$  such that  $V \neq \phi$  and  $V \subseteq f(U)$ .

## 2. Somewhat $b$ - $I$ -continuous functions

**Definition 2.1** Let  $(X, \tau, I)$  be ideal topological spaces and  $(Y, \sigma)$  be any topological space. A function  $f : X \rightarrow Y$  is said to be somewhat  $b$ - $I$  continuous function if for every  $U \in \sigma$  and  $f^{-1}(U) \neq \phi$  there exists a  $b$ - $I$ -open set  $V$  in  $X$  such that  $V \neq \phi$  and  $V \subseteq f^{-1}(U)$ .

**Example 2.2** Let  $X = \{a, b\}$ ,  $\tau = \{\phi, X\}$ ,  $I = \{\phi, \{a\}\}$ ,  $Y = \{a, b\}$ ,  $\sigma = \{\phi, X, \{a\}\}$ . Now define a function  $f : (X, \tau, I) \rightarrow (Y, \sigma)$  as follows:  $f(a) = a$ ;  $f(b) = a$ . Then clearly  $f$  is somewhat  $b$ - $I$ -continuous function.

**Theorem 2.3** Every somewhat semi- $I$ -continuous function is somewhat  $b$ - $I$ -continuous function.

*Proof* Let  $f : X \rightarrow Y$  be somewhat semi- $I$ -continuous function. Let  $U$  be any open set in  $Y$  such that  $f^{-1}(U) \neq \phi$ . Since  $f$  is somewhat semi- $I$ -continuous, there exists a semi- $I$ -open set  $V$  in  $X$  such that  $V \neq \phi$  and  $V \subseteq f^{-1}(U)$ . Since every semi- $I$ -open set is  $b$ - $I$ -open, there exist a  $b$ - $I$  open set  $V$  such that  $V \neq \phi$  and  $V \subseteq f^{-1}(U)$ , which implies that  $f$  is somewhat  $b$ - $I$ -continuous function. ■

**Remark 2.4** Converse of the above theorem need not be true in general which follows from the following example.

**Example 2.5** Let  $X = \{a, b, c\}$ ,  $\tau = \{\phi, X, \{a\}, \{b, c\}\}$ ,  $I = \{\phi, \{a\}\}$ ,  $Y = \{a, b, c\}$ ,  $\sigma = \{\phi, X, \{a\}, \{c\}, \{a, c\}\}$ . Define a function  $f : (X, \tau, I) \rightarrow (Y, \sigma)$  by  $f(a) = a$ ,  $f(b) = b$ ,  $f(c) = c$ . Then  $f$  is somewhat  $b$ - $I$ -continuous but not somewhat semi- $I$ -continuous. Since the inverse image of  $\{c\}$  in  $(Y, \sigma)$  is  $\{c\}$  in  $(X, \tau, I)$  which is not semi- $I$ -open set.

**Theorem 2.6** Every somewhat  $I$ -continuous function is somewhat semi- $I$ -continuous function.

**Theorem 2.7** Every somewhat  $I$ -continuous function is somewhat  $b$ - $I$ -continuous function.

*Proof* Theorem follows from Theorem 2.3 and Theorem 2.6. ■

**Remark 2.8** Converse of the above theorem need not be true in general which follows from the following example.

**Example 2.9** In example 2.5, the function  $f : X \rightarrow Y$  defined by  $f(a) = a$ ,  $f(b) = b$ ,  $f(c) = c$  is somewhat  $b$ - $I$ -continuous but not somewhat- $I$ -continuous since the inverse image of  $\{c\}$  is  $\{c\}$  which is not  $I$ -open set.

**Theorem 2.10** Let  $f : (X, \tau, I) \rightarrow (Y, \sigma)$  and  $g : (Y, \sigma) \rightarrow (Z, \eta)$  be any two functions. If  $f$  is somewhat  $b$ - $I$ -continuous function and  $g$  is continuous function, then  $g \circ f$  is somewhat  $b$ - $I$ -continuous function.

*Proof* Let  $U \in \eta$ . Suppose that  $g^{-1}(U) \neq \phi$ . Since  $U \in \eta$  and  $g$  is continuous function  $g^{-1}(U) \in \sigma$ . Suppose that  $f^{-1}(g^{-1}(U)) \neq \phi$ . Since by hypothesis  $f$  is somewhat  $b$ - $I$ -continuous function, there exists a  $b$ - $I$ -open set  $V$  in  $X$  such that  $V \neq \phi$  and  $V \subseteq f^{-1}(g^{-1}(U))$ . But  $f^{-1}(g^{-1}(U)) = (g \circ f)^{-1}(U)$ , which implies that  $V \subset (g \circ f)^{-1}(U)$ . Then  $g \circ f$  is somewhat  $b$ - $I$ -continuous function. ■

**Remark 2.11** In the above Theorem 2.10, if  $f$  is continuous function and  $g$  is somewhat  $b$ - $I$ -continuous function, then it is not necessarily true that  $g \circ f$  is somewhat  $b$ - $I$ -continuous function. The following example serves this purpose.

**Example 2.12** Let  $X = \{a, b, c\}$ ,  $\tau = \{\phi, X, \{a\}, \{b\}, \{a, b\}, \{b, c\}\}$ ,  $I = \{\phi, \{a\}\}$ ,  $\sigma = \{\phi, X, \{a\}, \{b, c\}\}$ ,  $\eta = \{\phi, X, \{a\}, \{c\}, \{a, c\}\}$ . Define a function  $f : (X, \tau) \rightarrow (X, \sigma)$  by  $f(a) = a$ ,  $f(b) = b$ ,  $f(c) = c$  and define  $g : (X, \sigma) \rightarrow (X, \eta)$  by  $g(a) = a$ ,  $g(b) = b$ ,  $g(c) = c$ . Then clearly  $f$  is continuous function and  $g$  is somewhat  $b$ - $I$ -continuous but  $g \circ f$  is not a somewhat  $b$ - $I$ -continuous function.

**Definition 2.13** Let  $M$  be a subset of a topological space  $(X, \tau)$ . Then  $M$  is said to be  $b$ - $I$ -dense in  $X$  if there is no proper  $b$ - $I$ -closed set  $C$  in  $X$  such that  $M \subset C \subset X$ .

**Theorem 2.14** Let  $f : (X, \tau, I) \rightarrow (Y, \sigma)$  be a function. Then the following are equivalent:

- (i)  $f$  is somewhat  $b$ - $I$ -continuous function.
- (ii) If  $C$  is a closed subset of  $Y$  such that  $f^{-1}(C) \neq X$ , then there is a proper  $b$ - $I$ -closed subset  $D$  of  $X$  such that  $D \supset f^{-1}(C)$ .
- (iii) If  $M$  is a  $b$ - $I$ -dense subset of  $X$  then  $f(M)$  is a dense subset of  $Y$ .

*Proof* (i)  $\Rightarrow$  (ii) : Let  $C$  be a closed subset of  $Y$  such that  $f^{-1}(C) \neq X$ . Then  $Y - C$  is an open set in  $Y$  such that  $f^{-1}(Y - C) = X - f^{-1}(C) \neq \phi$ . By hypothesis (i) there exists a  $b$ - $I$ -open set  $V$  in  $X$  such that  $V \neq \phi$  and  $V \subset f^{-1}(Y - C) = X - f^{-1}(C)$ . This means that  $X - V \supset f^{-1}(C)$  and  $X - V = D$  is a  $b$ - $I$ -closed set in  $X$ . This proves (ii).

(ii)  $\Rightarrow$  (iii) : Let  $M$  be a  $b$ - $I$ -dense set in  $X$ . We have to show that  $f(M)$  is dense in  $Y$ . Suppose not, then there exists a proper closed set  $C$  in  $Y$  such that  $f(M) \subset C \subset Y$ . Clearly  $f^{-1}(C) \neq X$ . Hence by (ii) there exists a proper  $b$ - $I$ -closed set  $D$  such that  $M \subset f^{-1}(C) \subset D \subset X$ . This contradicts fact that  $M$  is  $b$ - $I$ -dense in  $X$ .

(iii)  $\Rightarrow$  (i) : Suppose that (i) is not true. This means there exists a closed set  $C$  in  $Y$  such that  $f^{-1}(C) \neq X$ . But there is no proper  $b$ - $I$ -closed set  $D$  in  $X$  such that  $f^{-1}(C) \subseteq D$ . This means that  $f^{-1}(C)$  is  $b$ - $I$  dense in  $X$ . But by (iii)  $f(f^{-1}(C)) = C$  must be dense in  $Y$ , which is contradiction to the choice of  $C$ .

(ii)  $\Rightarrow$  (i) : Let  $U \in \sigma$  and  $f^{-1}(U) \neq \phi$ . Then  $Y - U$  is closed and  $f^{-1}(Y - U) = X - f^{-1}(U) \neq \phi$ . By hypothesis of (ii) there exists a proper  $b$ - $I$ -closed set  $D \supset f^{-1}(Y - U)$ . This implies that  $X - D \subset f^{-1}(U)$  and  $X - D$  is  $b$ - $I$ -open and  $X - D \neq \phi$ . ■

**Theorem 2.15** Let  $(X, \tau, I)$  be any ideal topological space. Let  $(Y, \sigma)$  be any topological space.  $A$  be an open set in  $X$  and  $f : (A, \tau/A) \rightarrow (Y, \sigma)$  be somewhat  $b$ - $I$ -continuous function such that  $f(A)$  is dense in  $Y$ . Then any extension  $F$  of  $f$  is somewhat  $b$ - $I$ -continuous function.

*Proof* Let  $U$  be any open set in  $(Y, \sigma, I^*)$  such that  $F^{-1}(U) \neq \phi$ . Since  $f(A) \subset Y$  is dense in  $Y$  and  $U \cap f(A) \neq \phi$  it follows that  $F^{-1}(U) \cap A \neq \phi$ . That is  $f^{-1}(U) \cap A \neq \phi$ . Hence by hypothesis on  $f$ , there exists a  $b$ -open set  $V$  in  $A$  such that  $V \neq \phi$  and  $V \subset f^{-1}(U) \subset F^{-1}(U)$  which implies  $F$  is somewhat  $b$ - $I$ -continuous function. ■

**Theorem 2.16** Let  $(X, \tau, I)$  and  $(Y, \sigma, I^*)$  be any two ideal topological spaces,  $X = A \cup B$  where  $A$  and  $B$  are open subsets of  $X$  and  $f : (X, \tau, I) \rightarrow (Y, \sigma, I^*)$  be a function such that  $f/A$  and  $f/B$  are somewhat  $b$ - $I$ -continuous function. Then  $f$  is somewhat  $b$ - $I$ -continuous function.

*Proof* Let  $U$  be any open set in  $(Y, \sigma, I^*)$  such that  $f^{-1}(U) \neq \phi$ . Then  $(f/A)^{-1}(U) \neq \phi$  or  $(f/B)^{-1}(U) \neq \phi$  or both  $(f/A)^{-1}(U) \neq \phi$  and  $(f/B)^{-1}(U) \neq \phi$ .

Case(i): Suppose  $(f/A)^{-1}(U) \neq \phi$ .

Since  $f/A$  is somewhat  $b-I$ -continuous, there exists a  $b-I$ -open set  $V$  in  $A$  such that  $V \neq \phi$  and  $V \subset (f/A)^{-1}(U) \subseteq f^{-1}(U)$ . Since  $V$  is  $b-I$ -open in  $A$  and  $A$  is open in  $X$ ,  $V$  is  $b-I$ -open in  $X$ . Thus  $f$  is somewhat  $b-I$ -continuous function.

Case(ii): Suppose  $(f/B)^{-1}(U) \neq \phi$ .

Since  $f/B$  is somewhat  $b-I$ -continuous, there exists a  $b-I$ -open set  $V$  in  $B$  such that  $V \neq \phi$  and  $V \subset (f/B)^{-1}(U) \subseteq f^{-1}(U)$ . Since  $V$  is  $b-I$ -open in  $B$  and  $B$  is open in  $X$ ,  $V$  is  $b-I$ -open in  $X$ . Thus  $f$  is somewhat  $b-I$ -continuous function.

Case(iii): Suppose  $(f/A)^{-1}(U) \neq \phi$  and  $(f/B)^{-1}(U) \neq \phi$ .

This follows from both the cases (i) and (ii). Thus  $f$  is somewhat  $b-I$ -continuous function. ■

**Definition 2.17** A topological space  $X$  is said to be  $b-I$ -separable if there exists a countable subset  $B$  of  $X$  which is  $b-I$ -dense in  $X$ .

**Theorem 2.18** If  $f$  is somewhat  $b-I$ -continuous function from  $X$  on to  $Y$  and if  $X$  is  $b-I$ -separable, then  $Y$  is separable.

*Proof* Let  $f : X \rightarrow Y$  be somewhat  $b-I$ -continuous function such that  $X$  is  $b-I$ -separable. Then by definition there exists a countable subset  $B$  of  $X$  which is  $b-I$ -dense in  $X$ . Then by Theorem 2.14,  $f(B)$  is dense in  $Y$ . Since  $B$  is countable  $f(B)$  is also countable which is dense in  $Y$ , which indicates that  $Y$  is separable. ■

### 3. $b-I$ -weakly Equivalent Topologies

**Definition 3.1** If  $X$  is a set and  $\tau$  and  $\sigma$  are topologies for  $X$ , then  $\tau$  is said to be weakly equivalent to  $\sigma$  provided if  $U \in \tau$  and  $U \neq \phi$ , then there is an open set  $V$  in  $(X, \tau)$  such that  $V \neq \phi$  and  $V \subset U$  and if  $U \in \sigma$  and  $U \neq \phi$ , there is an open set  $V$  in  $(X, \tau)$  such that  $V \neq \phi$  and  $V \subset U$ .

**Definition 3.2** If  $X$  is a set and  $\tau$  and  $\sigma$  are topologies for  $X$  and  $I$  is ideal for  $X$ , then  $\tau$  is said to be  $b-I$ -weakly equivalent to  $\sigma$  provided if  $U \in \tau$  and  $U \neq \phi$ , then there is a  $b-I$  open set  $V$  in  $(X, \sigma)$  such that  $V \neq \phi$  and  $V \subset U$  and if  $U \in \sigma$  and  $U \neq \phi$ , then there is a  $b-I$ -open set  $V$  in  $(X, \tau, I)$  such that  $V \neq \phi$  and  $V \subset U$ .

**Theorem 3.3** Let  $f : (X, \tau, I) \rightarrow (Y, \sigma)$  be somewhat continuous function and let  $\tau^*$  be a topology for  $X$ , which is  $b-I$ -weakly equivalent to  $\tau$  then the function  $f : (X, \tau^*, I) \rightarrow (Y, \sigma)$  is somewhat  $b-I$ -continuous.

*Proof* Let  $U$  be any open set in  $(Y, \sigma)$  such that  $f^{-1}(U) \neq \phi$ . Since by hypothesis  $f : (X, \tau, I) \rightarrow (Y, \sigma)$  is somewhat continuous by definition there exists an open set  $O$  in  $(X, \tau, I)$  such that  $O \neq \phi$  and  $O \subset f^{-1}(U)$ . Since  $O$  is an open set in  $(X, \tau, I)$  such that  $O \neq \phi$  and since by hypothesis  $\tau^*$  is  $b-I$ -weakly equivalent to  $\tau$  by definition there exists a  $b-I$ -open set  $V$  in  $(X, \tau^*)$  such that  $V \neq \phi$  and  $V \subset O \subset f^{-1}(U)$ . So  $O \subset f^{-1}(U)$ . Thus for any open set  $U$  in  $(Y, \sigma)$  such that  $f^{-1}(U) \neq \phi$ , there exists a  $b-I$ -open set  $V$  in  $(X, \tau^*, I)$  such that  $V \subset f^{-1}(U)$ . So  $f : (X, \tau^*, I) \rightarrow (Y, \sigma)$  is somewhat  $b-I$ -continuous function. ■

**Theorem 3.4** Let  $f : (X, \tau, I) \rightarrow (Y, \sigma)$  be somewhat  $b-I$ -continuous function and let  $\sigma^*$  be a topology for  $Y$ , which is weakly equivalent to  $\sigma$ . Then the function  $f : (X, \tau, I) \rightarrow (Y, \sigma^*)$  is somewhat  $b-I$ -continuous function.

*Proof* Let  $U$  be an open set in  $(Y, \sigma^*)$  such that  $f^{-1}(U) \neq \phi$  which implies  $U \neq \phi$ . Since  $\sigma$  and  $\sigma^*$  are weakly equivalent there exists an open set  $W$  in  $(Y, \sigma)$  such that  $W \neq \phi$  and  $W \subset U$ . Now,  $W$  is an open set such that  $W \neq \phi$ , which implies  $f^{-1}(W) \neq \phi$ . Now by hypothesis  $f : (X, \tau) \rightarrow (Y, \sigma)$  is somewhat  $b-I$  continuous function. Therefore there exists  $b-I$ -open set  $V$  in  $X$  such that  $V \subset f^{-1}(W)$ . Now

$W \subset U$  implies  $f^{-1}(W) \subset f^{-1}(U)$ . So we have  $V \subset f^{-1}(U)$ , which implies that  $f : (X, \tau, I) \rightarrow (Y, \sigma^*)$  is somewhat  $b$ - $I$ -continuous function. ■

#### 4. Somewhat $b$ - $I$ -open functions

**Definition 4.1** A function  $f : (X, \tau) \rightarrow (Y, \sigma, I)$  is said to be somewhat  $b$ - $I$ -open function provided that for  $U \in \tau$  and  $U \neq \phi$  there exists a  $b$ - $I$ -open set  $V$  in  $Y$  such that  $V \neq \phi$  and  $V \subseteq f(U)$ .

**Example 4.2** Let  $X = Y = \{a, b, c\}$ ,  $\tau = \{\phi, X, \{a\}\}$ ,  $I = \{\phi, \{a\}\}$ ,  $\sigma = \{\phi, X, \{a\}, \{b\}, \{a, b\}, \{b, c\}\}$ . Now define a function  $f : (X, \tau) \rightarrow (Y, \sigma, I)$  as follows  $f(a) = a$ ,  $f(b) = b$  and  $f(c) = c$ . Then clearly  $f$  is somewhat  $b$ - $I$ -open function.

**Theorem 4.3** Every somewhat semi- $I$ -open function is somewhat  $b$ - $I$ -open function.

*Proof* Let  $f : (X, \tau) \rightarrow (Y, \sigma, I)$  be a somewhat semi- $I$ -open function. Let  $U \in \tau$  and  $U \neq \phi$ . Since  $f$  is somewhat semi- $I$ -open function there exists a semi- $I$ -open set  $V$  in  $Y$  such that  $V \neq \phi$  and  $V \subset f(U)$ . But every semi- $I$ -open set is  $b$ - $I$ -open. Therefore there exists a  $b$ - $I$ -open set  $V$  in  $Y$  such that  $V \neq \phi$  and  $V \subset f(U)$ , which implies that  $f$  is somewhat  $b$ - $I$ -open function. ■

**Remark 4.4** Converse of the above Theorem need not be true in general, which follows from the following example.

**Example 4.5** Let  $X = Y = \{a, b, c\}$ ,  $\tau = \{\phi, X, \{a\}, \{c\}, \{a, c\}\}$ ,  $I = \{\phi, \{a\}\}$ ,  $\sigma = \{X, \phi, \{a\}, \{b, c\}\}$ . Define a function  $f : (X, \tau) \rightarrow (Y, \sigma, I)$  by  $f(a) = a$ ,  $f(b) = b$  and  $f(c) = c$ . Then  $f$  is somewhat  $b$ - $I$ -open but not somewhat semi- $I$ -open. Since the image of  $\{c\}$  in  $(X, \tau)$  is  $\{c\}$  in  $(Y, \sigma, I)$  which is not semi- $I$ -open set.

**Theorem 4.6** Every somewhat  $I$ -open function is somewhat  $b$ - $I$ -open function.

*Proof* Let  $f : (X, \tau) \rightarrow (Y, \sigma, I)$  be somewhat  $I$ -open function. Let  $U \in \tau$  and  $U \neq \phi$ . Since  $f$  is somewhat  $I$ -open function, there exists an open set  $V \in \sigma$  such that  $V \neq \phi$  and  $V \subseteq f(U)$ . But every  $I$ -open set is  $b$ - $I$ -open. So there exists a  $b$ - $I$ -open set  $V \in \sigma$  such that  $V \neq \phi$  and  $V \subseteq f(U)$ . Thus  $f$  is somewhat  $b$ - $I$ -open function. ■

**Remark 4.7** Converse of the above theorem need not be true in general, which follows from the following example.

**Example 4.8** In example 4.5, the function  $f : X \rightarrow Y$  defined by  $f(a) = a$ ,  $f(b) = b$ ,  $f(c) = c$  is somewhat  $b$ - $I$ -open but not somewhat  $I$ -open, since the image of  $\{a, c\}$  in  $(X, \tau)$  is  $\{a, c\}$  in  $(Y, \sigma, I)$  which is not  $I$ -open set.

**Theorem 4.9** If  $f : (X, \tau) \rightarrow (Y, \sigma)$  is an open map and  $g : (Y, \sigma) \rightarrow (Z, \eta, I)$  is somewhat  $b$ - $I$ -open map then  $g \circ f : (X, \tau) \rightarrow (Z, \eta, I)$  is somewhat  $b$ - $I$ -open map.

*Proof* Let  $U \in \tau$ . Suppose that  $U \neq \phi$ . Since  $f$  is an open map  $f(U)$  is open and  $f(U) \neq \phi$ . Thus  $f(U) \in \sigma$  and  $f(U) \neq \phi$ . Since  $g$  is somewhat  $b$ - $I$ -open map and  $f(U) \in \sigma$  such that  $f(U) \neq \phi$  there exists a  $b$ - $I$ -open set  $V \in \eta$ ,  $V \subset g(f(U))$ , which implies  $g \circ f$  is somewhat  $b$ - $I$ -open function. ■

**Theorem 4.10** If  $f : (X, \tau) \rightarrow (Y, \sigma, I)$  be one-one and onto mapping, then the following are equivalent:

- (i)  $f$  is somewhat  $b$ - $I$ -open map.
- (ii) If  $C$  is a closed subset of  $X$  such that  $f(C) \neq Y$ , then there is a  $b$ - $I$ -closed subset  $D$  of  $Y$  such that  $D \neq Y$  and  $D \supset f(C)$ .

*Proof* (i)  $\Rightarrow$  (ii) : Let  $C$  be any closed subset of  $X$  such that  $f(C) \neq Y$ . Then  $X - C$  is open in  $X$  and  $X - C \neq \phi$ . Since  $f$  is somewhat  $b$ - $I$ -open, there exists a  $b$ - $I$ -open set  $V \neq \phi$  in  $Y$  such that  $V \subset f(X - C)$ . Put  $D = Y - V$ . Clearly  $D$  is  $b$ - $I$ -closed in  $Y$  and we claim that  $D \neq Y$ . For if  $D = Y$ , then  $V = \phi$  which is a contradiction. Since  $V \subset f(X - C)$ ,  $D = Y - V \supset Y - [f(X - C)] = f(C)$ .

(ii)  $\Rightarrow$  (i) : Let  $U$  be any non empty open set in  $X$ . Put  $C = X - U$ . Then  $C$  is a closed subset of  $X$  and  $f(X - U) = f(C) = Y - f(U)$  implies  $f(C) \neq \phi$ . Therefore, by (ii) there is a  $b$ - $I$ -closed subset  $D$  of  $Y$  such that  $D \neq Y$  and  $f(C) \subset D$ . Put  $V = X - D$ . Clearly  $V$  is a  $b$ - $I$ -open set and  $V \neq \phi$ . Further,  $V = X - D \subset Y - f(C) = Y - [Y - f(U)] = f(U)$ . ■

**Theorem 4.11** Let  $f : (X, \tau) \rightarrow (Y, \sigma, I)$  be somewhat  $b$ - $I$ -open function and  $A$  be any open subset of  $X$ . Then  $f/A : (A, \tau/A) \rightarrow (Y, \sigma, I)$  be also somewhat  $b$ - $I$ -open function.

*Proof* Let  $U \in \tau/A$  such that  $U \neq \phi$ . Since  $U$  is open in  $A$  and  $A$  is open in  $(X, \tau)$ ,  $U$  is open in  $(X, \tau)$  and since by hypothesis  $f : (X, \tau) \rightarrow (Y, \sigma, I)$  is somewhat  $b$ - $I$ -open function, there exists a  $b$ - $I$ -open set  $V$  in  $Y$  such that  $V \subset f(U)$ . Thus for any open set  $U$  in  $(A, \tau/A)$  with  $U \neq \phi$ , there exists a  $b$ -open set  $V$  in  $Y$  such that  $V \subset f(U)$  which implies  $f/A$  is somewhat  $b$ - $I$ -open function. ■

**Theorem 4.12** Let  $(X, \tau)$  be topological space and  $(Y, \sigma, I)$  be a ideal topological space and  $X = A \cup B$  where  $A$  and  $B$  are open subsets of  $X$  and  $f : (X, \tau) \rightarrow (Y, \sigma, I)$  be a function such that  $f/A$  and  $f/B$  is somewhat  $b$ - $I$ -open, then  $f$  is also somewhat  $b$ - $I$ -open function.

*Proof* Let  $U$  be any open subset of  $(X, \tau)$  such that  $U \neq \phi$ . Since  $X = A \cup B$  either  $A \cap U \neq \phi$  (or)  $B \cap U \neq \phi$  (or) both  $A \cap U \neq \phi$  and  $B \cap U \neq \phi$ . ■
